Post-Operative Instructions

Canine: Tac

On March 14, 2016 Tac was neutered, micro-chipped, rabies vaccinated, and given a Snap IV DX test. His test was negative. Please keep him in a quiet place this evening and let him rest. He may have water the remainder of today. You can feed him a light meal tomorrow morning and his normal amount tomorrow evening.

Tac has sutures that will dissolve and normally do not need to be removed. His incision will need to stay clean and dry for one week. Please do not bathe him during this time and he should be kept in a clean dry area – inside or crated if possible.

Excessive licking or chewing at the surgical site can cause worse swelling and additional complications and should be discouraged. Being around females in heat or attempts to breed can also cause complications and is to be avoided.

If any problems arise, please call us at (870) 793-3337.

Thank you for letting us treat Tac.
Nanci Solis, DVM
